

Evaluating, Risking, and Ranking Carbon Sequestration Buoyant Traps with Application to Nearshore Gulf of Mexico

MADDIE LAIDLAW

Masters Saturday April 30, 2022

CCS in the Gulf Coast

(Meckel et al 2021)

- CCS can play a vital role in reducing carbon emissions
- US Gulf Coast is an attractive region to develop CCS
 - Cost lies in capturing emissions
 - Uncertainty lies within subsurface reservoirs
- **How should CCS developers identify high-quality sequestration prospects?**

Outline

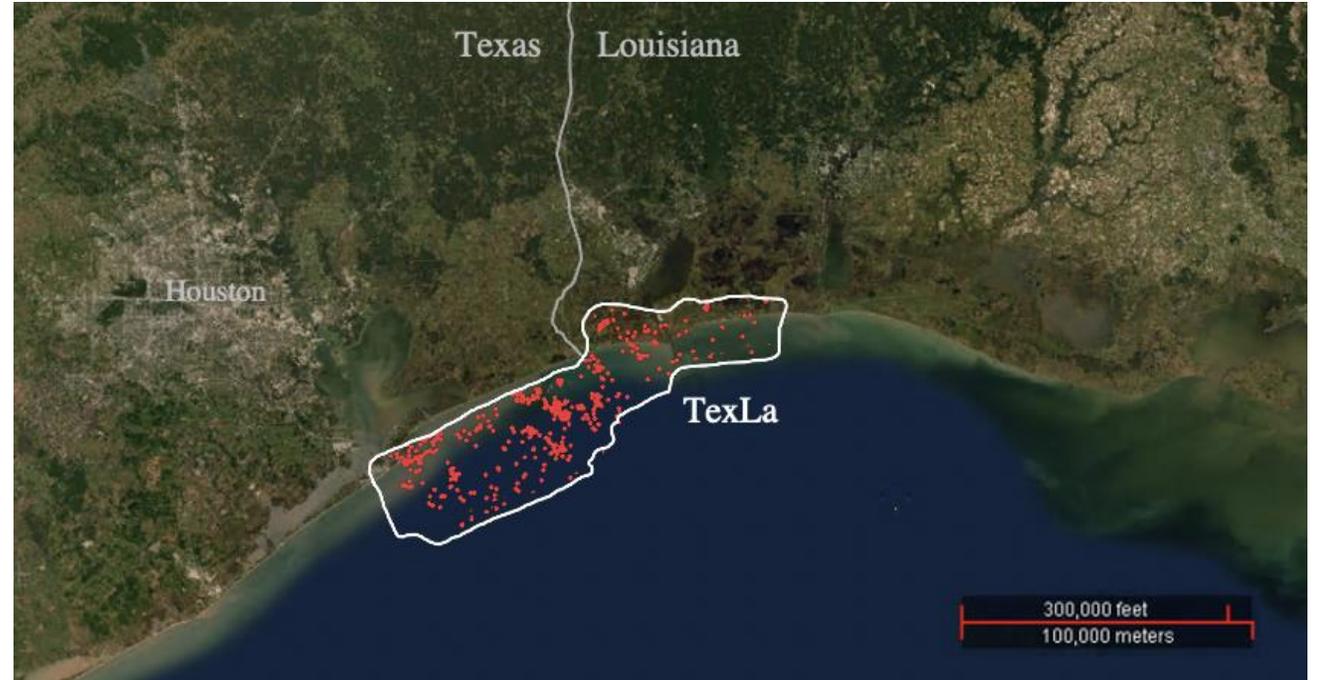

I. Evaluating

- Previous Prospect Inventories
- Creating a New Inventory

II. Risking

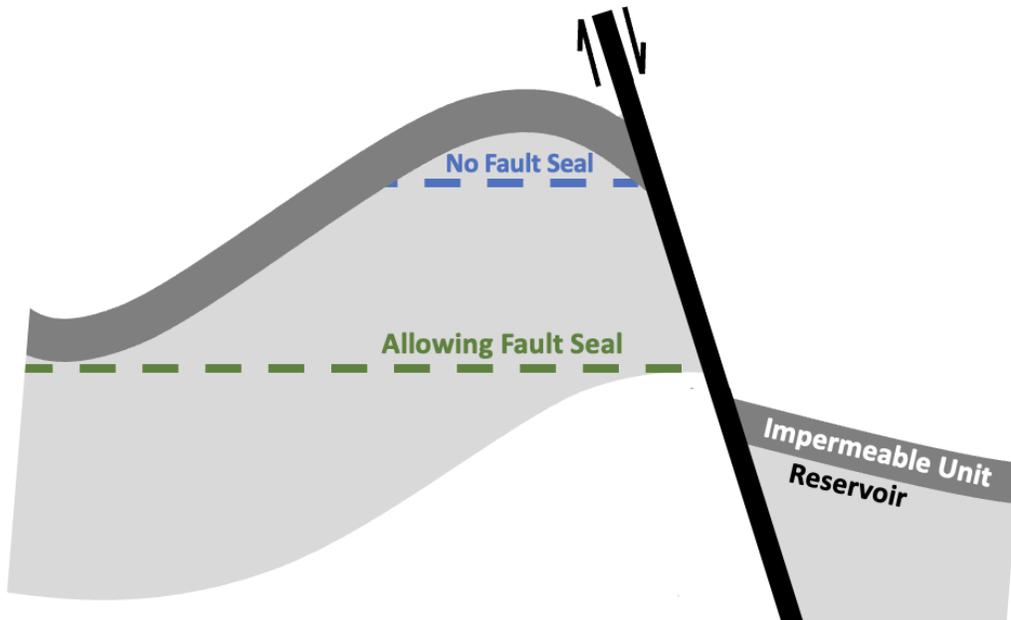

- Geologic Risk
- Above Ground Risk

III. Ranking

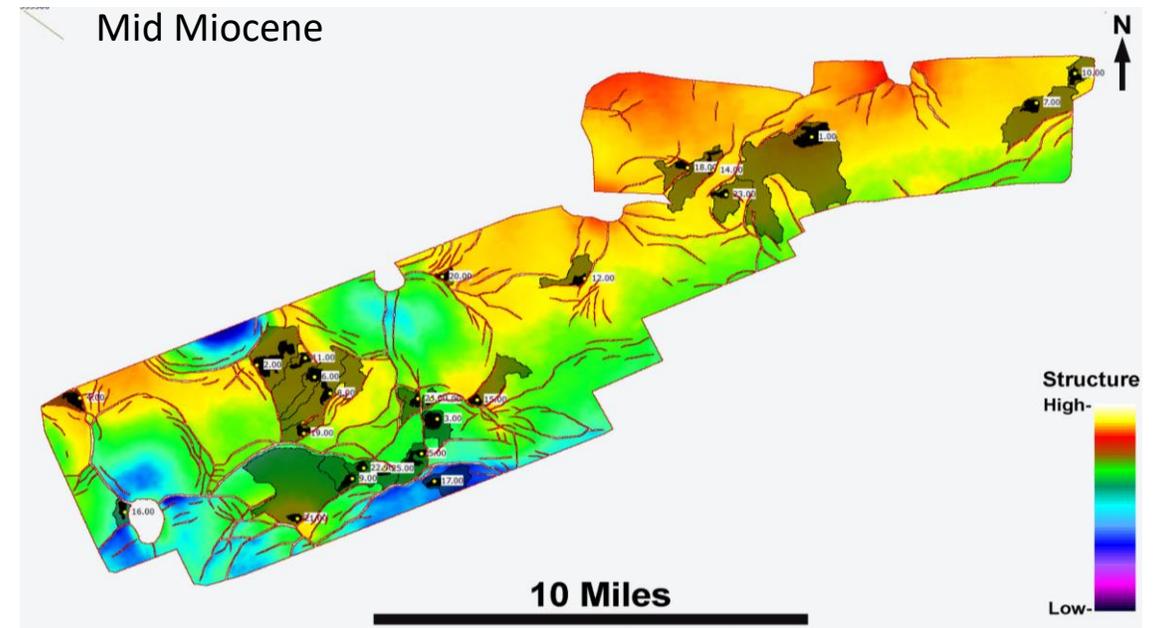

Carbon Storage Prospect Inventory

What is a CCS Prospect?

First Edition TexLa CCS Prospect Inventory

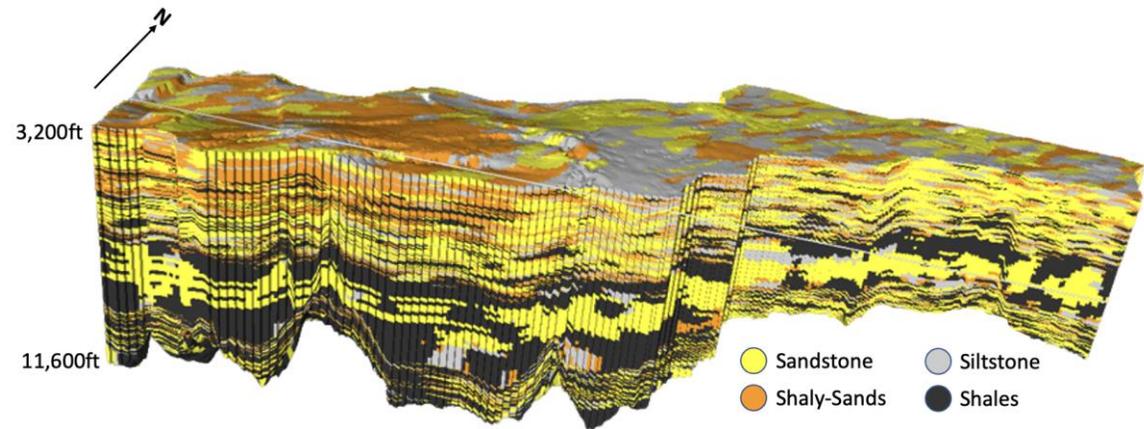

(DeAngelo Unpublished, DeAngelo 2019)

- Individual subsurface sequestration opportunities
- Allowing fault seal expands...
 - Volume of carbon that can be sequestered per prospect
 - Number of prospects to choose between

- Used map-based fetch & closure analysis to identify traps
- Excludes the potential for fault seal
- Doesn't reflect our knowledge of GOM stratigraphy

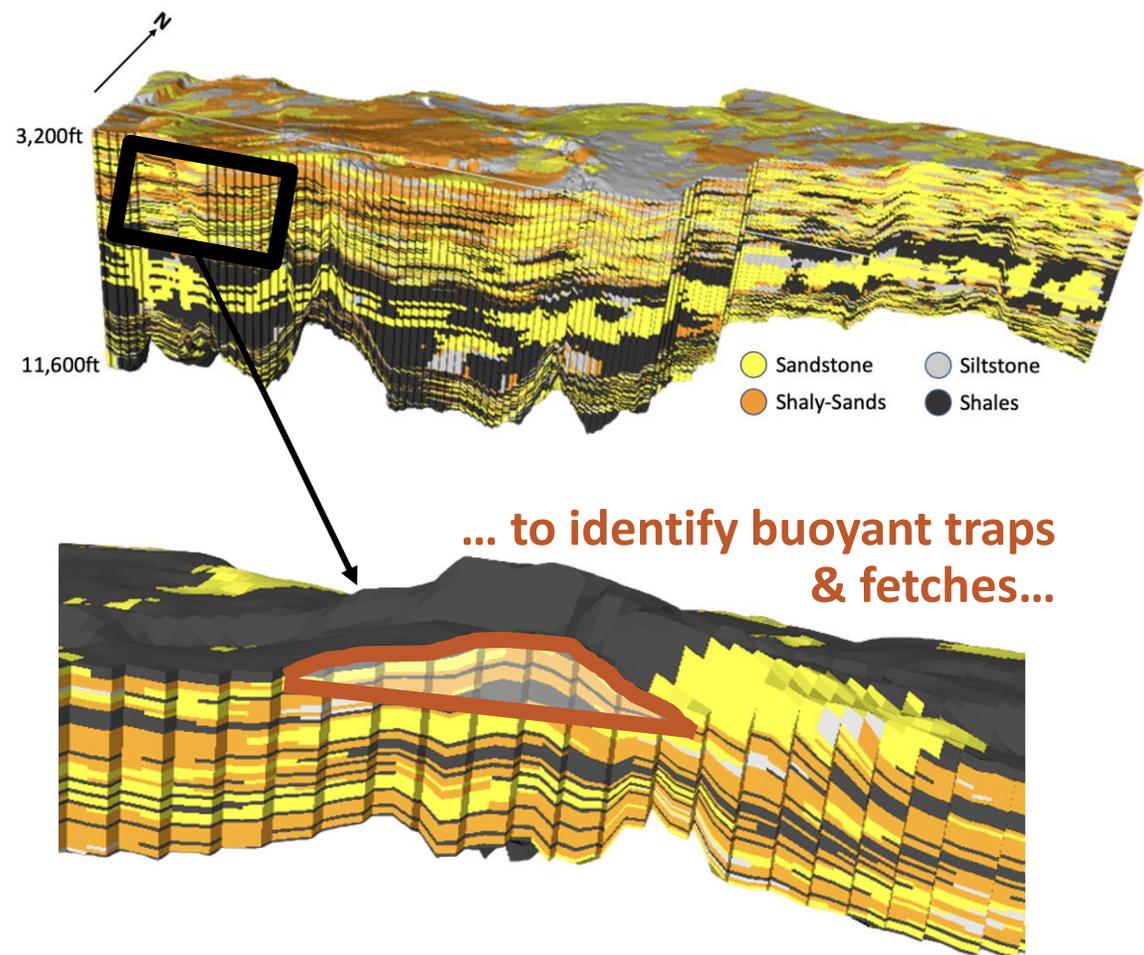

2nd Edition TexLa Prospect Inventory

Incorporate real Miocene geologic data...

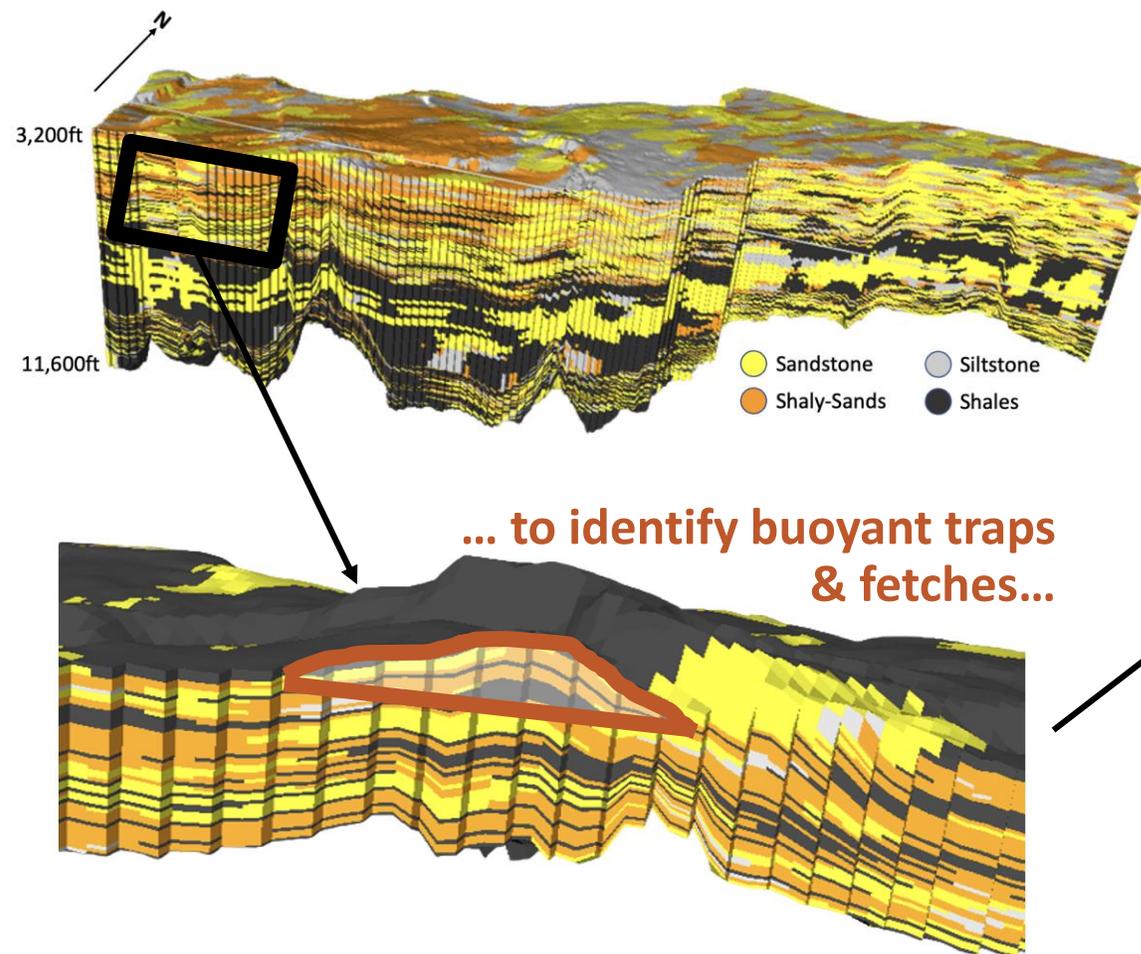

2nd Edition TexLa Prospect Inventory

Incorporate real Miocene geologic data...

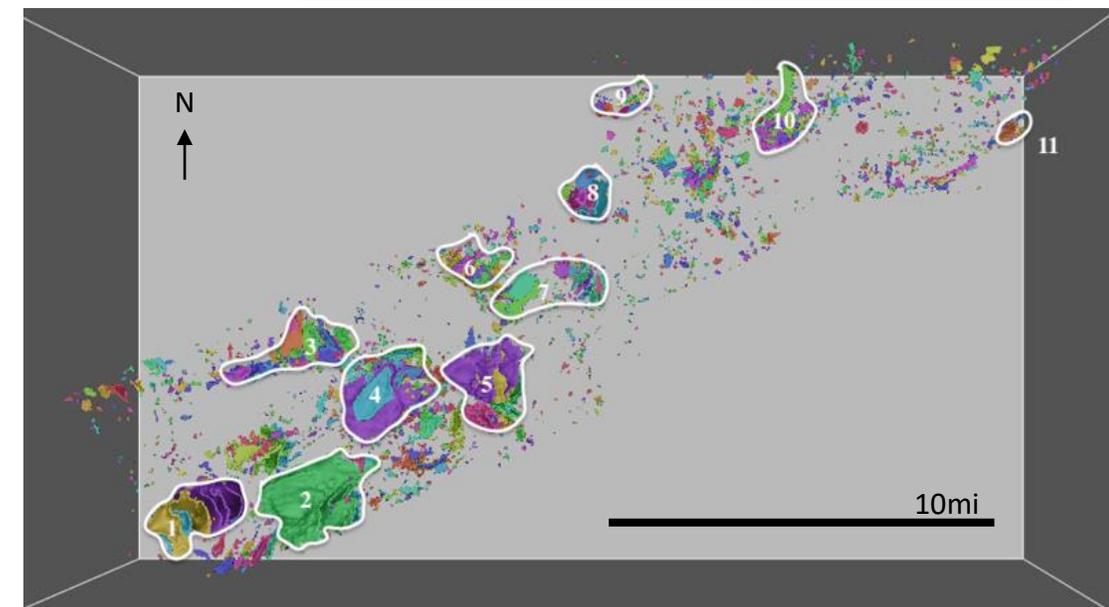

2nd Edition TexLa Prospect Inventory

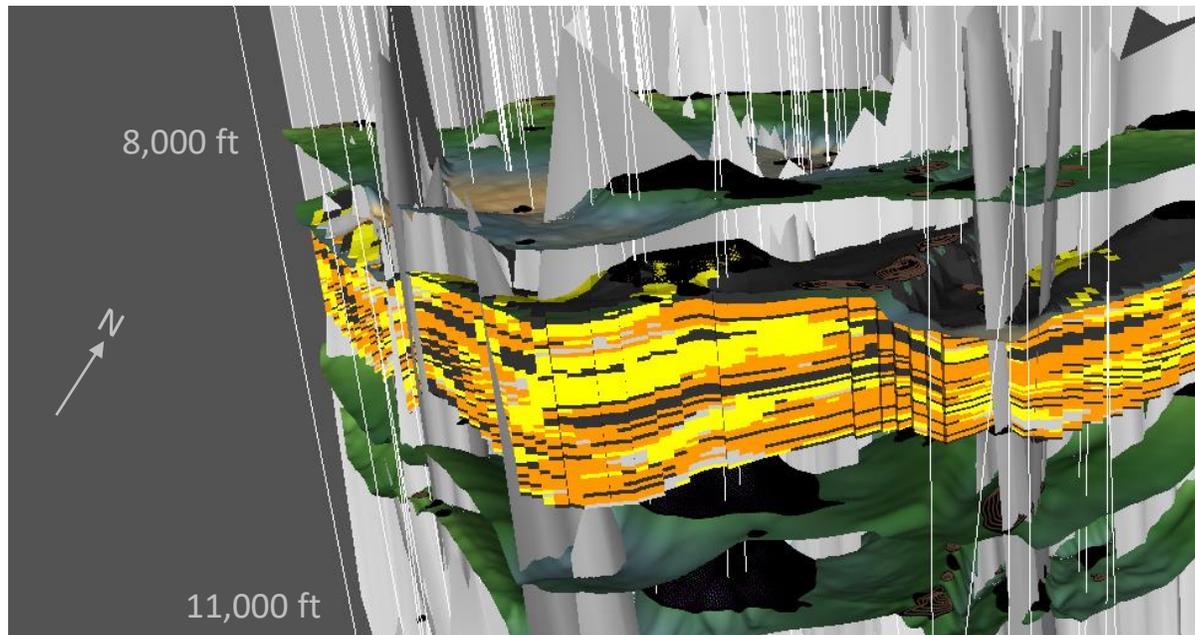

Incorporate real Miocene geologic data...

... creating a Multi-Reservoir Prospect Inventory

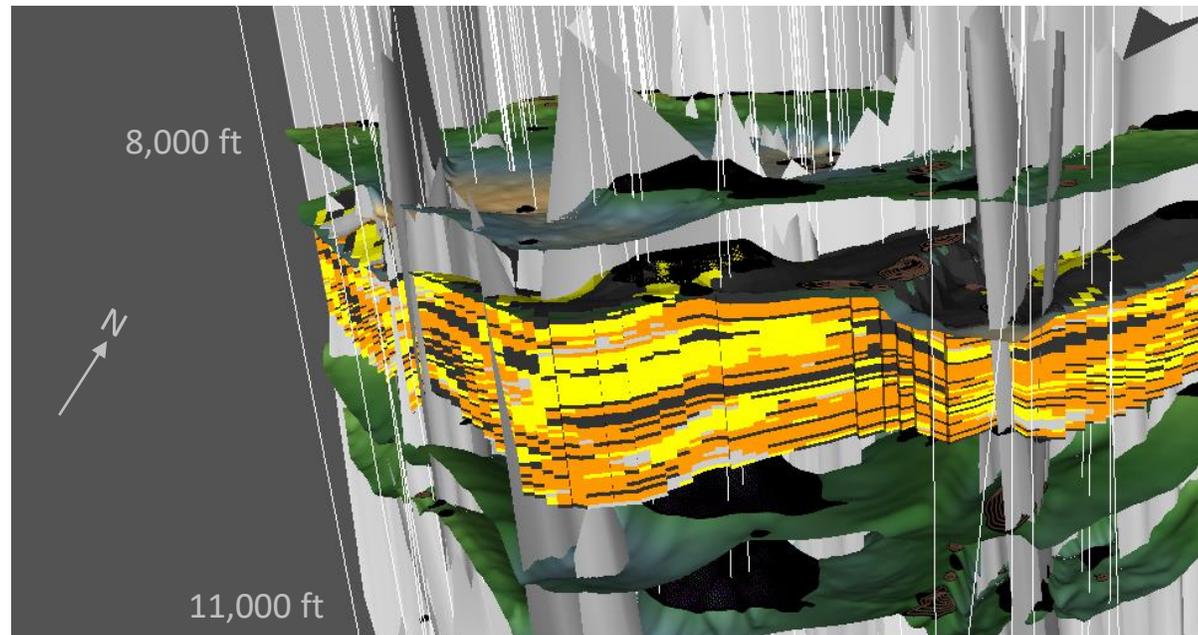

Quantifying Prospect Risk

Subsurface Risk

- How much?
- How fast?
- How secure?

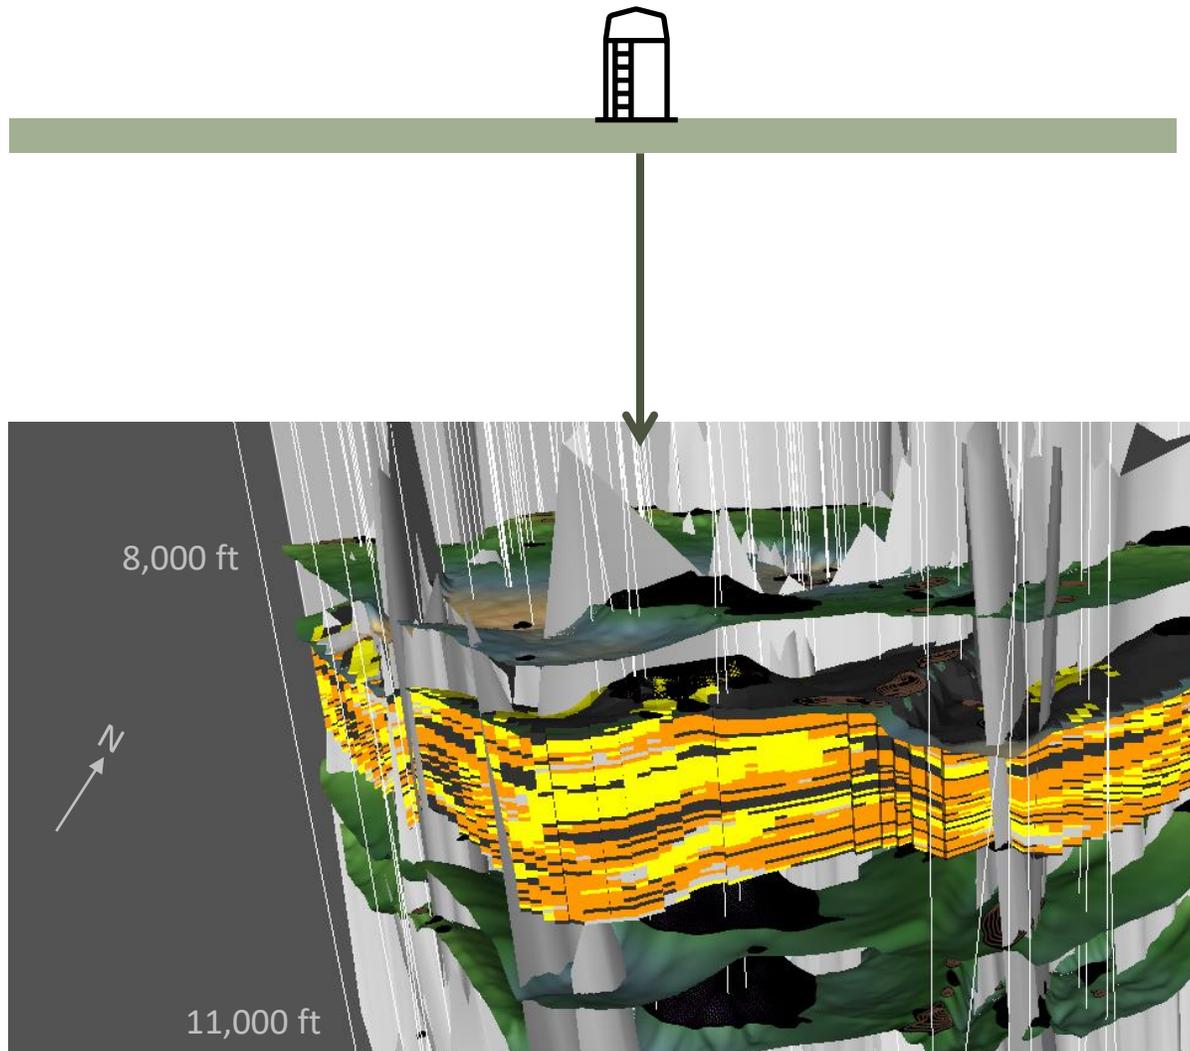

Quantifying Prospect Risk

Subsurface Risk

- How much? Capacity
- How fast? Injectivity
- How secure? Confining Zone

Quantifying Prospect Risk

Above-Ground Risk

- Financial
- Political
- Permitting

Subsurface Risk

- How much? Capacity
- How fast? Injectivity
- How secure? Confining Zone

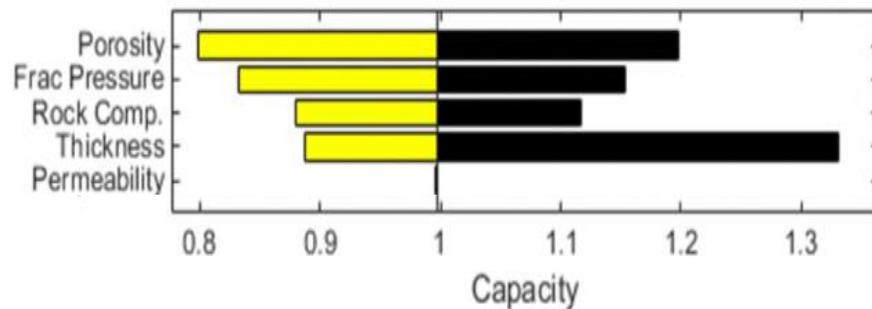

Capacity Risk

How much CO₂ can a prospect store?

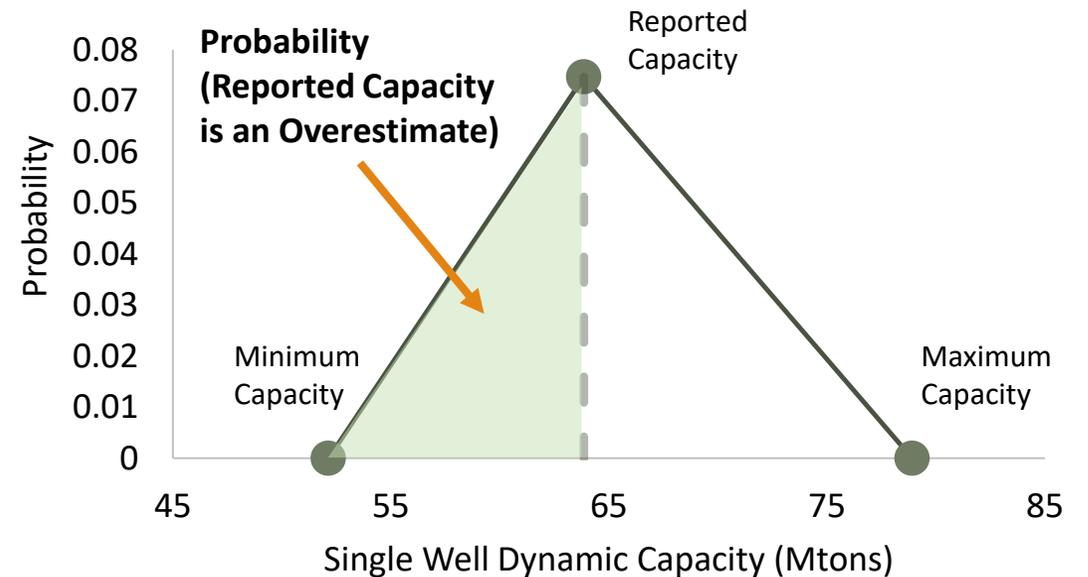

Dynamic Estimate

EASiTool Simulator

- Closed form analytical solution for capacity
- Considers pressure, reservoir properties, fluid properties
- Gives sensitivity analysis & multi-well capacity results

Uncertainty

Injectivity Risk

At what rate can the reservoir store CO₂?

Reservoir Thickness

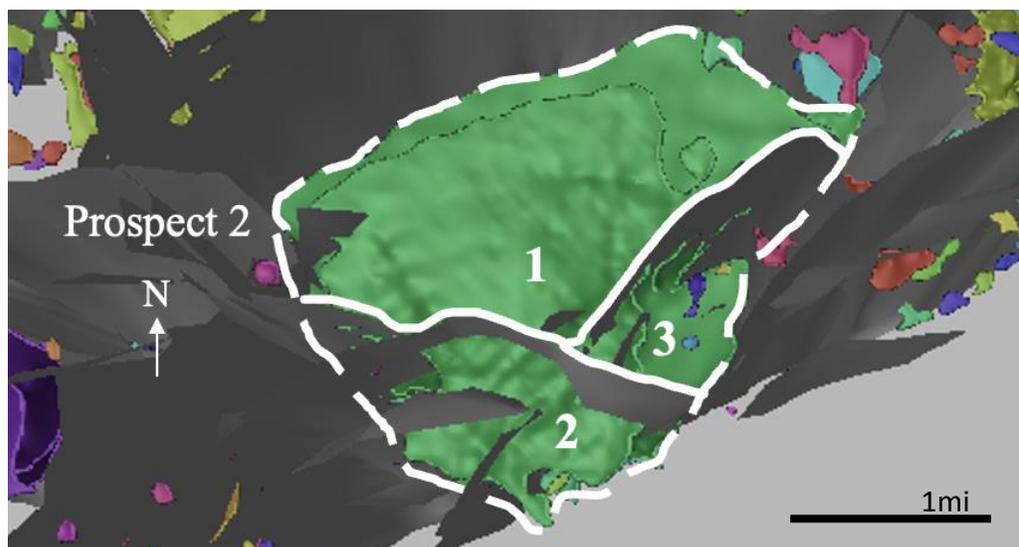

Reservoir Permeability

Reservoir Pressure

Reservoir Continuity

Vertical: Net to Gross Ratio (NTG)

Lateral: Fault Compartmentalization

Risk Level	Thickness	Pressure	Continuity
Dark Green	✓	✓	✓
Light Green	✓		✓
Yellow	✓		✗
Orange	✓	✗	✗
Brown	✗	✗	✗

Financial Risk

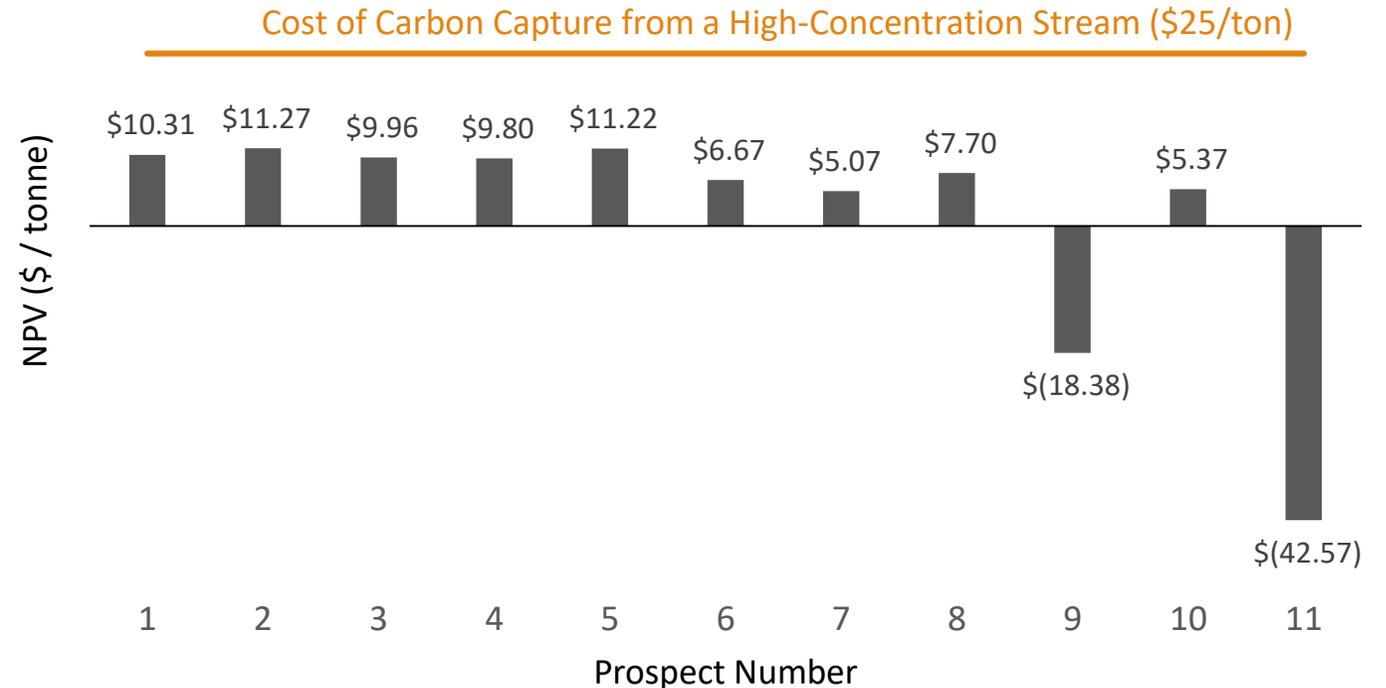

Prospect Differentiation

- Evaluate relative costs of sequestration between prospects
- Identify prospects that are most likely to support upstream capture costs

Discounted Cash Flow Model Inputs

- Values sequestration portion of the projects
- Capacity & Injectivity estimates from EASiTool modelling
- Technical expenses from published sources
- Revenues based on current and potential future 45Q tax credit policies

Prospect Value (\$ / ton)

* Values using \$50/ton 45Q Credit Value

Ranking with CRS Maps

Composite Risk Segment (CRS) Mapping

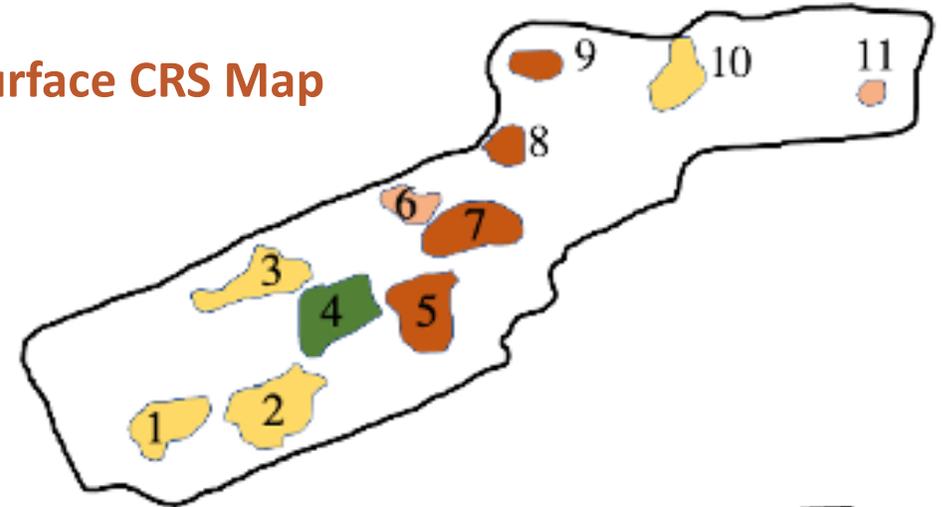

- Adapted from a hydrocarbon industry ranking tool
- Flexible to incorporate any risk elements possible
- Intuitive, spatial display of risk
- Provides broad prospect differentiation

Overlaying Risk Colours

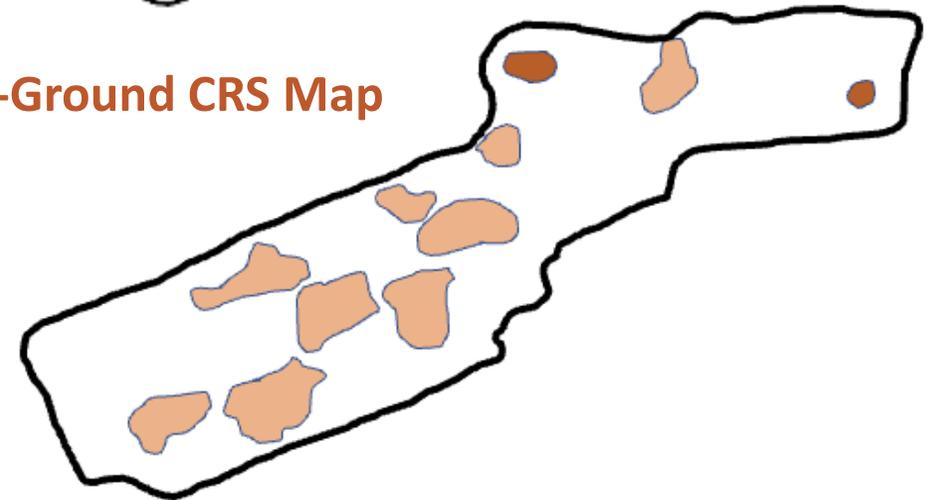

Risk Level				
Lowest	Low	Average	High	Highest

Subsurface CRS Map

Above-Ground CRS Map

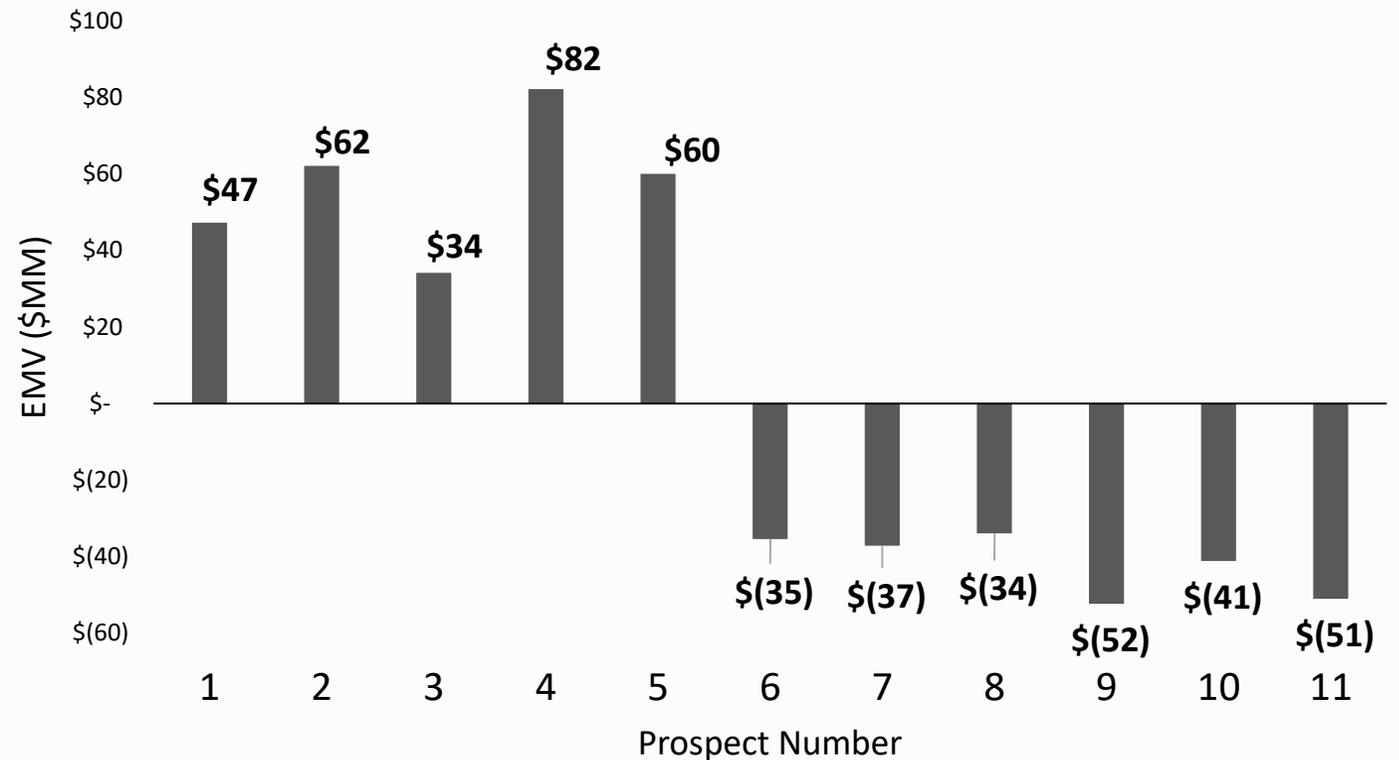

Ranking with EMV

Estimated Monetary Value (\$MM)

- Quantitative, risk-weighted measure of value
- Dependent on “Chance of Success” composite value of all geologic risk scores
- Allows for finer-scale prospect differentiation

Varying Chance of Success's Impact on Ranking

Conclusions

Study Goals

- Improve TexLa prospect inventory using real geology
- Quantify geological and Above-Ground risk factors
- Identify prospects with the maximum probability of success

Study Conclusions

- Identified larger CCS opportunities with multi-reservoir potential within the TexLa Miocene section
- Risking workflow that is repeatable and based on commonly available data
- Ranking prospects focuses developers on highest-quality prospects

Trap Risk

Does the subsurface structure collect CO₂?

Trap Type
Classification

4 Way Dip (4WD)

3 Way Fault (3WF)

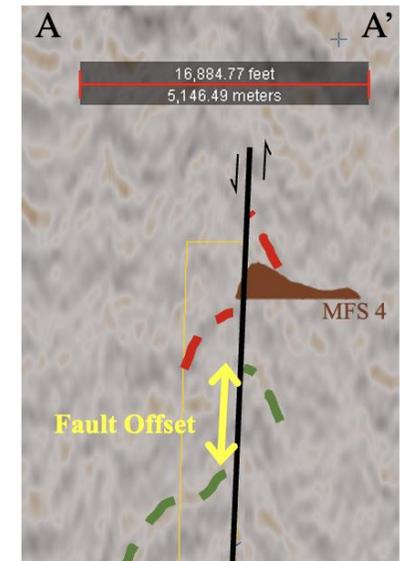

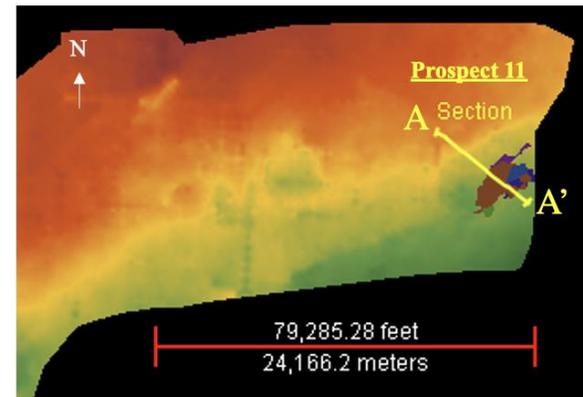

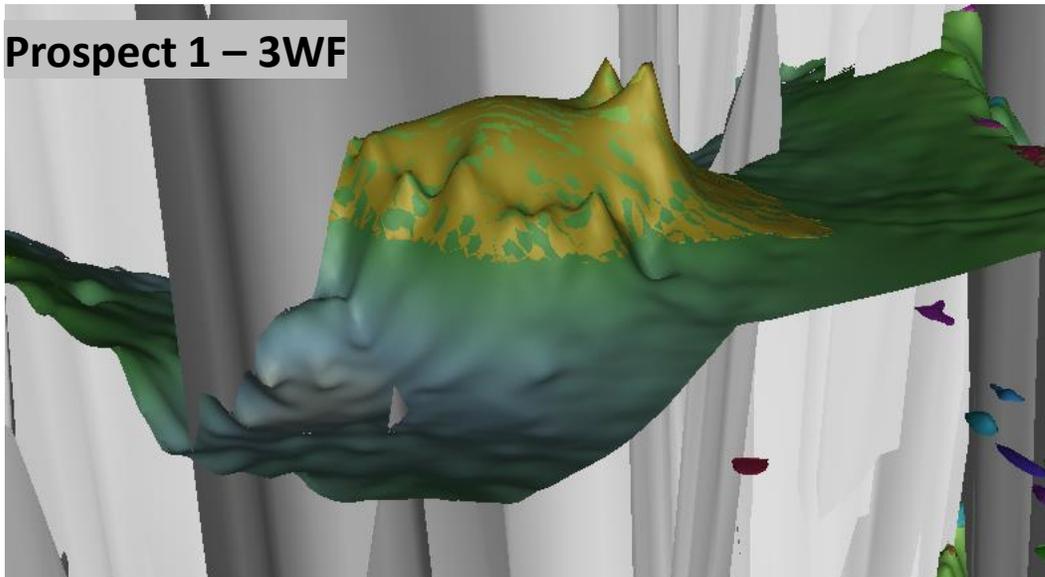

Determine fault offset :
reservoir thickness ratio

Offset : Thickness > 2

Offset : Thickness ~ 2

Offset : Thickness < 2

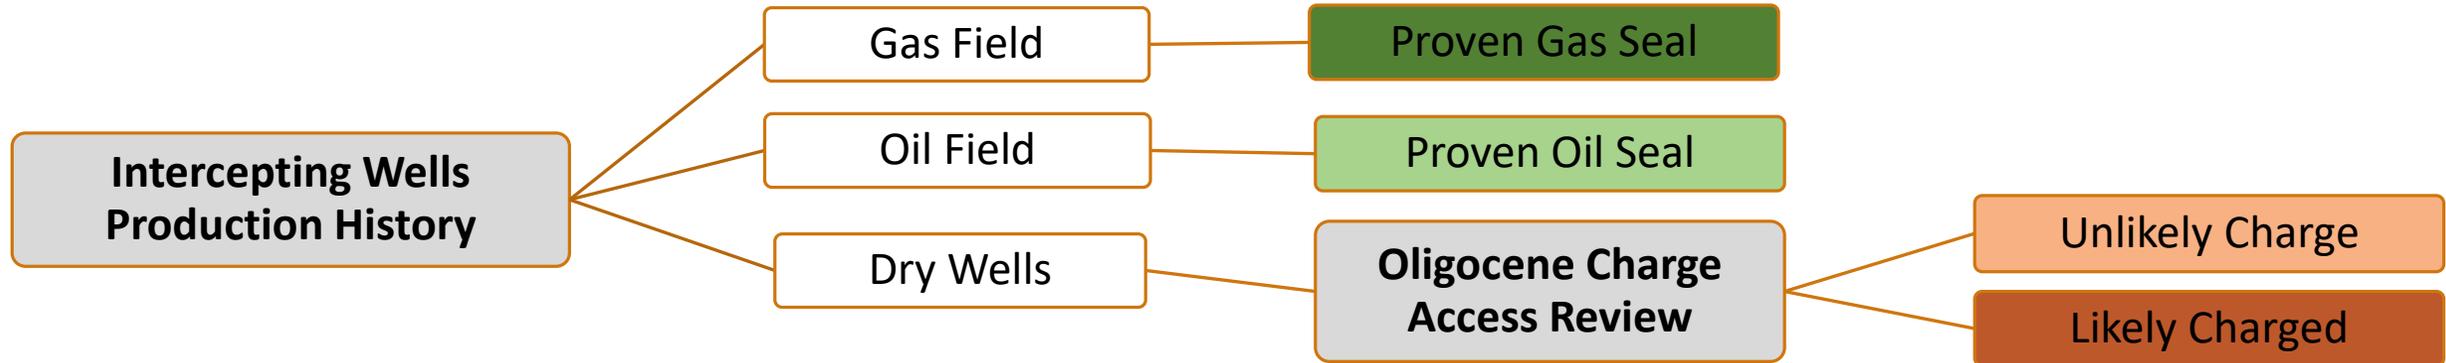

Prospect 1 – 3WF

Seismic data courtesy of SEI Inc.,
Interpretation belongs to the University of Texas at Austin

Seal Risk

Does the lithology prevent the vertical migration of CO₂?

Well Summary Report

42245031240000

General Information Header

Country: UNITED STATES

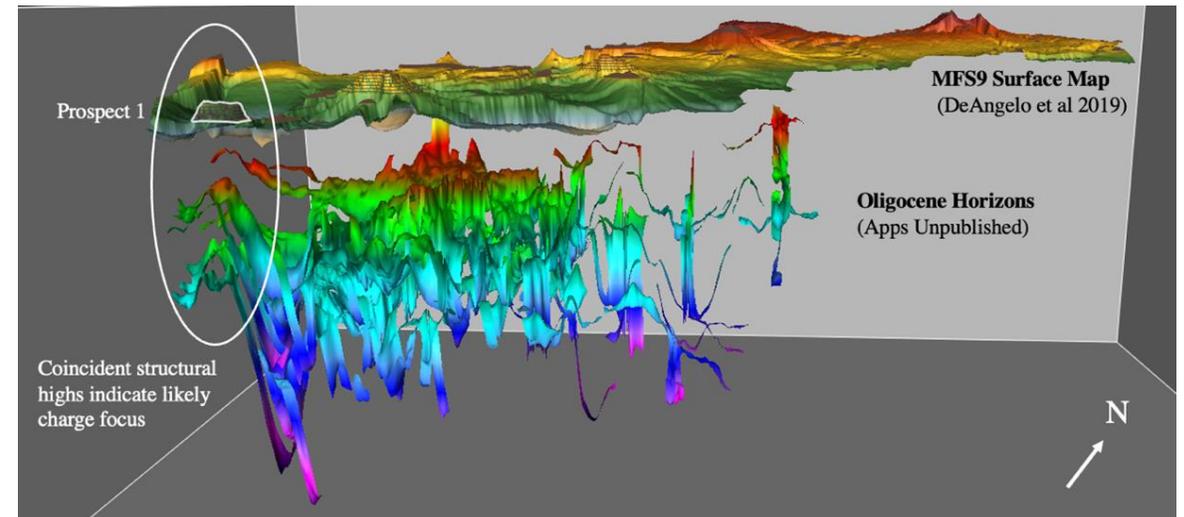

Final Status: OIL PRODUCER

Drill Total Depth: 8,600 FT

Log Total Depth:

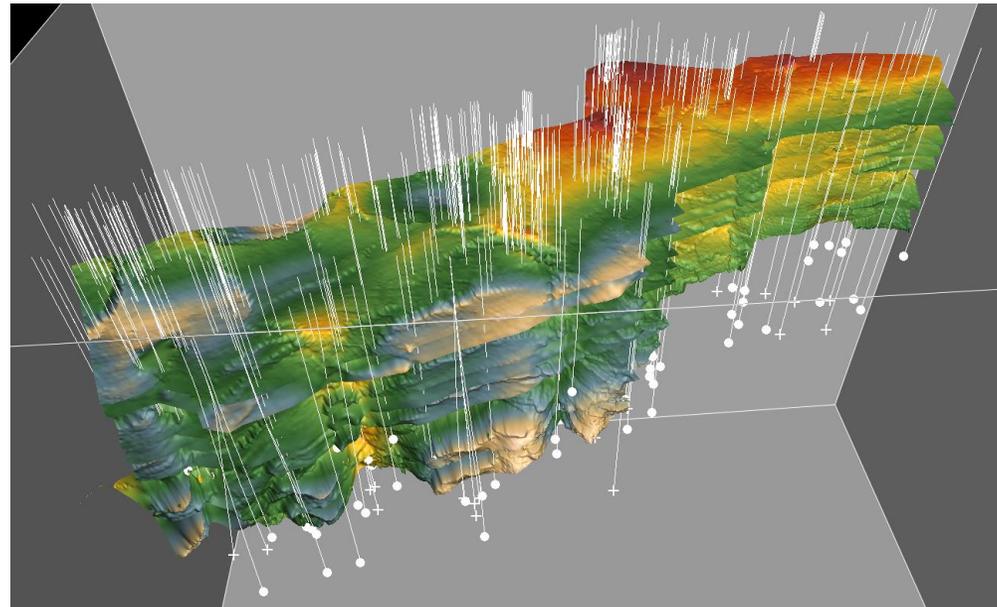

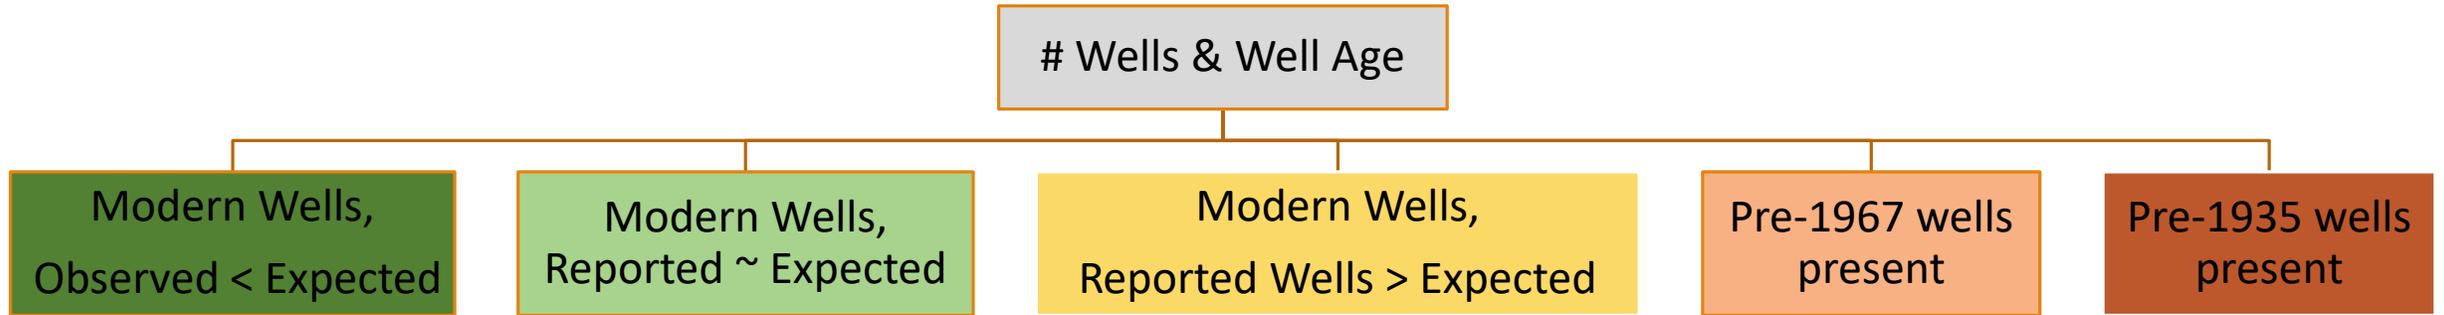

True Vertical Depth:

Current Operator: KINGWOOD EXPLORATION LLC

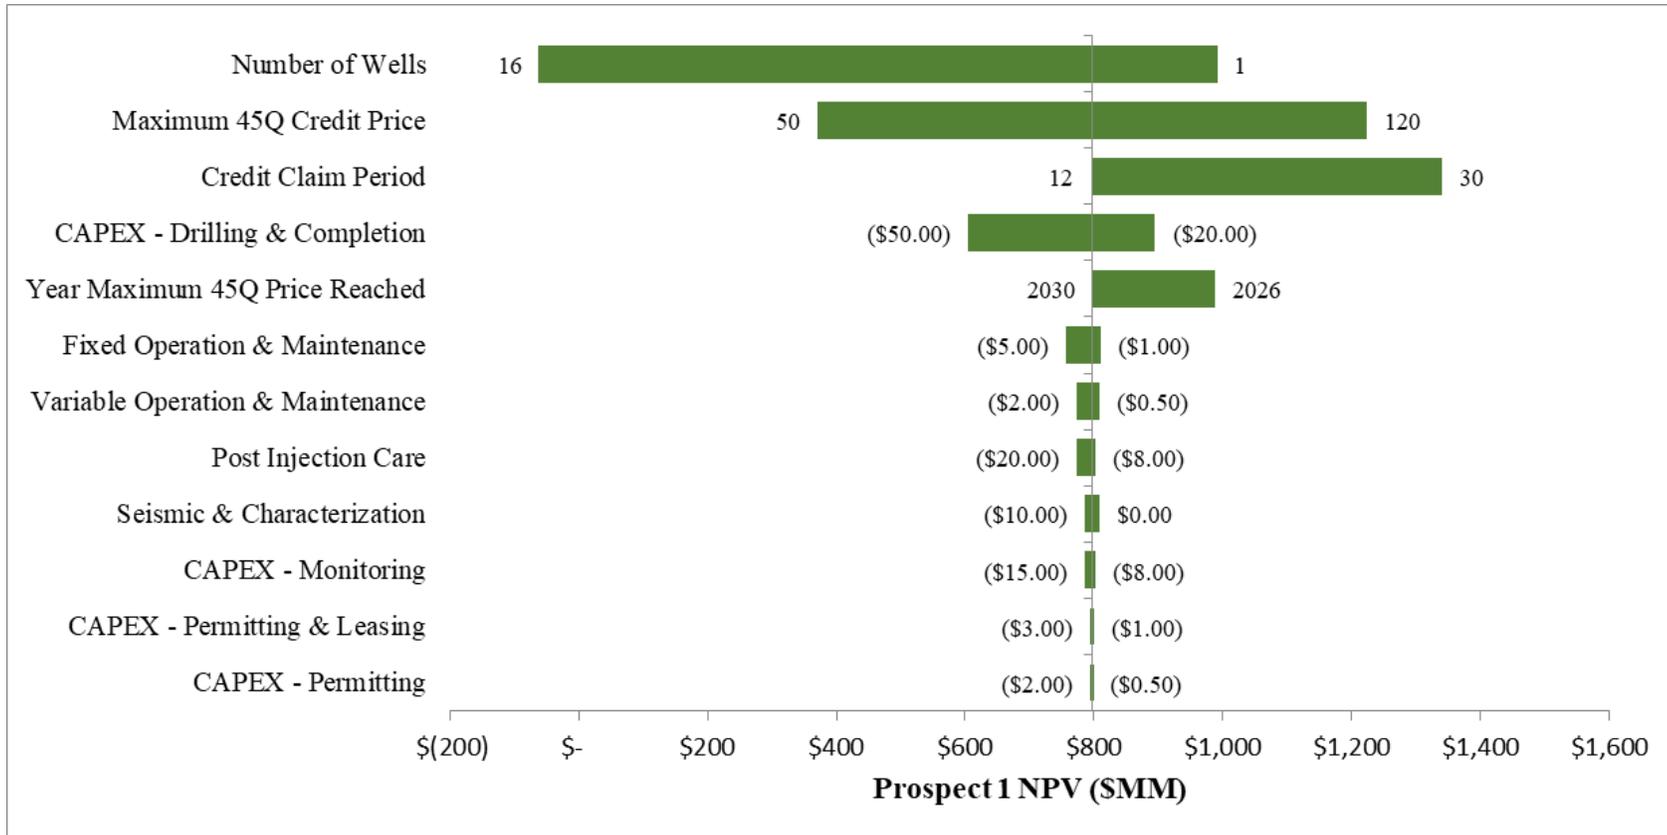

Well Leak Risk

Has the Gulf's hydrocarbon exploration history impacted a prospect's ability to hold CO₂?

multidisciplinary studies for interdisciplinary solutions

Financial Risk
